Disclaimer

RomyRom audits various projects where smart contracts are involved. We do not guarantee that the purpose of the project may be fraud, “rug pull”, withdrawing liquidity, selling and transferring the project and its team.

An audit of a smart contract is not an offer, investment advice, or a recommendation to buy tokens.

RomyRom is not responsible for any losses and speculative investments. Use the information obtained from this audit for informational purposes.

Do your own research on the project, documentation, and its social media.

Object under study

Ermine MEME (EMEM) token (ECR20)

According to the developer, the \$EMEM token is useless. Built for entertainment.

Technical characteristics of the EMEM token

Ecosystem – Ethereum

Token standard – ERC20

Number of decimal places after the decimal point – 18

Name – Ermine MEME

Ticker – EMEM

Contract address - 0x412C5f584F5238fDa50E4F8a5aF75c59fa467DbD

Total supply – 428,280,000,000,000 EMEM

Total minted – 428,280,000,000,000 EMEM

Verify of smart contracts

Verified contract source code in browser:

<https://etherscan.io/token/0x412C5f584F5238fDa50E4F8a5aF75c59fa467DbD#code>

Contract Name: ErmineMEME

Compiler Version v0.8.19+commit.7dd6d404

Optimization Enabled: Yes with 200 runs

Other Settings: default evmVersion

Contract Source Code Verified (Exact Match)

Checking hashes (SHA256) of OpenZeppelin libraries

File name	SHA256 Checksum	Conclusion

Owner: 0x08516A38064fE45FE0BFded1D4421CEd3A5ae9F3

Control modifiers: none

Issuance of new tokens is not available

Functions created by the developer

Below is a study of the functions created by the developer

The **ErmineMEME.sol** file includes 1 function

Function name	Permissions	Description
burn(uint256 amount)	available to everyone	Burns the amount of the caller's tokens if there are enough tokens on his balance (\geq amount). The burned variable stores the number of burned tokens over time.

Warning! Tokens after burning are not subject to recovery and are not sent back for mint. After burning, the total supply of EMEM tokens will be reduced by amount.

Risks for the user may be associated with an accidental call to the burn function, which may lead to the irretrievable loss of their tokens.

Don't call any functions, in any contracts, unless you understand what might happen next.

Conclusion

During the study of the ErmineMEME contract, no errors were found in the source code. The mint is not available. The code audit of the libraries used did not reveal any changes made to them. Library file hashes correspond to stock values. Having the burn function available to everyone can create a risk of losing user EMEM tokens if it is accidentally invoked.

No vulnerabilities were found. The ErmineMEME smart contract has successfully passed security tests and does not pose a threat when used.
